Welcome to How to Configure the VPN on an iPad

The UD VPN is used to create a secure connection to access UD Resources not available otherwise, including your OET network drive or H: drive. If you wish to access you H: drive, please watch the OET video on configuring the VPN and the Remote Desktop Protocol client.

To configure the UD VPN, go to your iPad's home screen and click on the Settings icon. Under Settings on the left of the screen, select General. On the right under General, select VPN. Select Add VPN Configuration. In the Add Configuration box, select the IPSec button. This will bring you to a Cisco VPN configuration. In the Description field, you can type anything to make the configuration meaningful to you. In the server field, type vpn.nss.udel.edu. In the Account field type your UDelNet ID. This is the same ID that you use for UDSIS or webforms. Leave the password field blank. You'll fill in your password later in another box. In the Group Name type, udeluser and in the Secret field, type vpnclient. That's v-p-n-c-l-i-e-n-t, all one word. Tap Save on the top right of the screen.

You will now see your configuration appear under VPN on the right. To start the VPN tap the icon in the off position to on. An authentication dialog box will appear with your UDelNet ID already in it. Add your password and click OK. This is the password for your UDelNet ID. The VPN button will now report that it is on and in the Status field you will see a time clock with the time that you have been connected.

If you need to edit your VPN configuration, you can always click on the arrow next to the VPN configuration, edit what you need to, and click save again.

To disconnect from the VPN, either power down your iPad or Tap the VPN's on button or icon to off.

If you have any questions, please write to oet-help@udel.edu.
